

PTS BASEMENT BAUFIX BB200

PTS BASEMENT BAUFIX BB200

220 Ltr Tank capacity for the removal of seepage water from behind basement tanking membranes and grey water from utility rooms.

The Basement Baufix **BB200** is an underfloor sump, which provides good storage capacity and has the benefit of having two pumps, with floats set at different levels to provide duty assist or duty standby operation. Without a great deal of construction work, it disposes of water from areas below the local backup level. The application as collecting tank for sewage is not permitted. The pressure resistant plastic tank is placed without formwork into the concrete base and forms a collection tank for underfloor pipework via the preformed 150/110 and 110mm inlet connections, as well as ground water from behind the membrane through the open top in accordance with BS8102:1990.

These units can also be used for the drainage of domestic waste water from washbasins, sinks, showers and washing machines.

The unit is delivered fully assembled, complete with integral non return valve and self venting pump.

Optional Accessories:

- Sealed polycarbonate cover with stainless steel frame.
- Mains powered high level alarm with rechargeable battery backup facility.
