[pts-jung.co.uk](http://pts-jung.co.uk)

You have purchased a product made by Pentair Jung Pumpen and with it, therefore, also excellent quality and service. Secure this service by carrying out the installation works in accordance with the instructions, so that our product can perform its task to your complete satisfaction. Please remember that damage caused by incorrect installation or handling will adversely affect the guarantee.

This appliance can be used by children aged 8 years or over and by persons with limited physical, sensory or intellectual capabilities, or with limited experience and knowledge, provided that they are supervised or have been instructed in the safe use of the appliance and are aware of the dangers involved. Children must not be allowed to play with the appliance. Cleaning and user maintenance must not be carried out by children unless they are supervised.

### **Damage prevention in case of failure**

Like any other electrical device, this product may fail due to a lack of mains voltage or a technical defect.

If damage (including consequential damage) can occur as a result of product failure, the following precautions can be taken at your discretion:

- Installation of a water level dependent (under circumstances, mains-independent) alarm system, so that the alarm can be heard before damage occurs.
- Inspection of the collecting tank/chamber for tightness up to the top edge before – or at the latest, during – installation or operation of the product.
- Installation of backflow protection for drainage units that can be damaged by wastewater leakage upon product failure.
- Installation of a further product that can compensate in case of failure of the other product (e.g. duplex unit).
- Installation of an emergency power generator.

As these precautions serve to prevent or minimise consequential damage upon product failure, they are to be strictly observed as the manufacturer's guideline – in line with the standard DIN EN specifications as state of the art – when using the product (Higher Regional Court Frankfurt/Main, Ref.: 2 U 205/11, 06/15/2012).

## SAFETY INSTRUCTIONS

This instruction manual contains essential information that must be observed during installation, operation and servicing. It is therefore important that the installer and the responsible technician/operator read this instruction manual before the equipment is installed and put into operation. The manual must always be available at the location where the pump or the plant is installed.

Failure to observe the safety instructions can lead to the loss of all indemnity.

In this instruction manual, safety information is distinctly labelled with particular symbols. Disregarding this information can be dangerous.

 General danger to people

 Warning of electrical voltage

### **NOTICE!** Danger to equipment and operation

#### **Qualification and training of personnel**

All personnel involved with the operation, servicing, inspection and installation of the equipment must be suitably qualified for this work and must have studied the instruction manual in depth to ensure that they are sufficiently conversant with its contents. The supervision, competence and areas of responsibility of the personnel must be precisely regulated by the operator. If the personnel do not have the necessary skills, they must be instructed and trained accordingly.

#### **Safety-conscious working**

The safety instructions in this instruction manual, the existing national regulations regarding accident prevention, and any internal working, operating and safety regulations must be adhered to.

#### **Safety instructions for the operator/user**

All legal regulations, local directives and safety regulations must be adhered to.

The possibility of danger due to electrical energy must be prevented.

Leakages of dangerous (e.g. explosive, toxic, hot) substances must be discharged such that no danger to people or the environment occurs. Legal regulations must be observed.

#### **Safety instructions for installation, inspection and maintenance works**

As a basic principle, works may only be carried out to the equipment when it is shut down. Pumps or plant that convey harmful substances must be decontaminated.

All safety and protection components must be re-fitted and/or made operational immediately after the works have been completed. Their effectiveness must be checked before restarting, taking into account the current regulations and stipulations.

#### **Unauthorised modifications, manufacture of spare parts**

The equipment may only be modified or altered in agreement with the manufacturer. The use of original spare parts and accessories approved by the manufacturer is important for safety reasons. The use of other parts can result in liability for consequential damage being rescinded.

#### **Unauthorised operating methods**

The operational safety of the supplied equipment is only guaranteed if the equipment is used for its intended purpose. The limiting values given in the "Technical Data" section may not be exceeded under any circumstances.

#### **Instructions regarding accident prevention**

Before commencing servicing or maintenance works, cordon off the working area and check that the lifting gear is in perfect condition.

Never work alone. Always wear a hard hat, safety glasses and safety shoes and, if necessary, a suitable safety belt.

Before carrying out welding works or using electrical devices, check to ensure there is no danger of explosion.

People working in wastewater systems must be vaccinated against the pathogens that may be found there. For the sake of your health, be sure to pay meticulous attention to cleanliness wherever you are working.

Make sure that there are no toxic gases in the working area.

Observe the health and safety at work regulations and make sure that a first-aid kit is to hand.

In some cases, the pump and the pumping medium may be hot and could cause burns.

For installations in areas subject to explosion hazards, special regulations apply!

## APPLICATION

The WCfix 260 is a sewage disposal unit for a toilet above and below the backpressure level.

- There should only be a few users and there must be an additional toilet available above the local back-flow level.
- Only domestic wastewater without hazardous substances according to EN 12056 can be discharged.
- The unit is operated in combination with a cistern with a capacity of at least 6 litres. If the amount of flush water is less than 6 litres, for example due to water-saving buttons, then we cannot guarantee that the unit will work properly.

A washbasin, a shower and a bidet can also be connected. These additional facilities must be installed in the same room. The standard EN 12050-3 does not permit any other additional facilities, such as a washing machine, sink, dishwasher or bath, to be installed.

If installed in compliance with the regulations and used for the intended purpose, then this appliance meets the protective requirements of the EMC directive 2014/30/EU and is suitable for domestic use and connection to a mains power supply.

It can be used wherever the installation of a toilet is required as part of renovation or conversion work. The faecal matter and toilet paper are conveyed by the pump to existing collecting tanks.

**NOTICE!** However, sanitary articles, paper towels, moist toilet paper, leftovers, solvents, chemicals, grease etc. must not be disposed of in the toilet.

The flow rate in the pressure pipe must be at least 0.7 m/s.

The limitation of use due to the maximum delivery head is 0.4 bar (4.0 m of water).

The resulting geod. delivery head and range, depending upon the pipe diameter, is shown in figure 2. The permissible medium temperature is 35° C, the operating mode is intermittent duty S3, 30% (3 min. operation - 7 min. interval)

**NOTICE!** When the unit is installed in bathrooms and shower rooms VDE regulations 0100 part 701 must be complied with!

The WCfix 260 is frost-resistant to -20°C when stored in dry conditions. Once installed, however, the residual water in the toilet must not be allowed to freeze.

### Scope of supply

1 complete WCfix 260, 1 non-return valve 1¼", 1 discharge elbow d=32, 2 connection sleeves d=40, 1 "Prohibited substances" sticker, 2 wood screw 4x40, 2 rawlplug S6, 1 active carbon filter, 2 pipe clips, drill template, this manual.

## ELECTRICAL CONNECTION

### WARNING!

The WCFIX 260 must only be connected to sockets that have been installed properly in accordance with the regulations and are protected with at least 10 A (slow) and FI-safety switches (30mA)

**NOTICE!** Only qualified electricians may carry out electrical works to the WCFIX 260.

**NOTICE!** Never put the mains plug in water! If water gets into the plug, this can cause malfunctions and damage.

The relevant standards (such as EN standards), country-specific regulations (such as VDE in Germany), and the regulations of the local power supply companies must be observed.

Observe the operating voltage (see the type plate)!

No additional motor protection is required, since the system has an integrated coil thermostat.

Unacceptably high temperatures and long periods of continuous operation cause the thermostat to shut down the motor.

### WARNING!

After the thermostat has switched off the system, pull out the mains plug before remedying the fault, since the device can switch itself on again automatically if the power is still connected.

### General explication

The WC-fix 260 operates automatically depending on the water level in the tank.

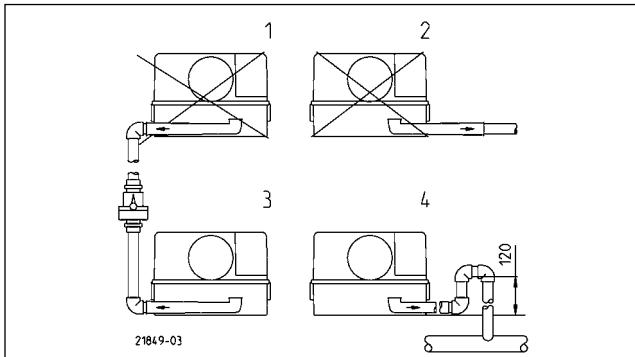

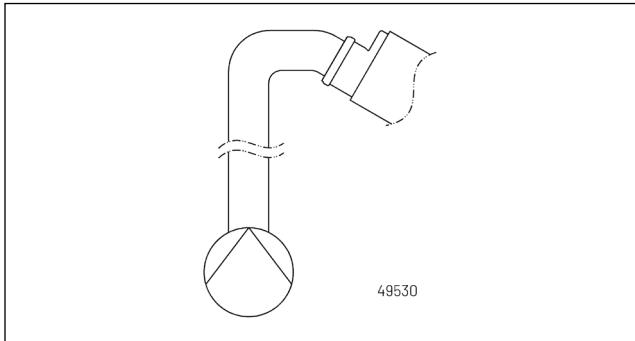

## INSTALLATION

The WCfix can be fixed directly at commercial toilets (DIN 1387 or 1388) with a horizontal discharge pipe. The height of the installation level up to the middle of the connection piece must be 180 mm.

**NOTICE!** A connection tube between the WCfix and the toilet can cause malfunctions.

This sort of installation is not in accordance with the rules of the German institute for construction engineering.

The required space behind the toilet is the same as the one of a commercial flushing box with a content of 9l. The distance between the end of the connecting branch of the toilet and the wall must have a minimum of 275 mm, to allow a removing of the unit without demounting the basin. The enclosed flap-trap must be installed into the pressure tube (preferred installation: vertical, connection 1¼ inch). We recommend installing a shut-off valve after the check valve in the pressure pipe. This allows the check valve to be serviced easily. If the pressure pipe is installed entirely horizontally to the collecting or main pipe, a stagnation loop must be installed in the pressure pipe. If the pressure pipe is installed with the pressure pipe transition point located below the system installation level, then the pressure pipe must be enlarged after its highest point by a wider-dimensioned pipe to prevent any suction lifting effect from being created which would cause the tank to empty automatically.

**NOTICE!** Do not connect more additional objects than a wash-basin, a bidet and a shower.

Please note that the invert of these additional connections must be located at least 180 mm above the installation level to prevent the water sealant in the odour trap from mixing with the wastewater from the system. In addition, the stagnation loop needs to be installed as closely as possible to the WCfix. See drawing on page 38. This will reduce sewage backpressure and air exchange in the water pipe leading to the shower.

For additional connections there are 2 separate inlets, above the bottom, at the rear side of the tank for tubes with an outside diameter of 40 mm.

In order to decrease bad smells there is an activated carbon filter which can be installed if required.

Before installation the foil must be removed.

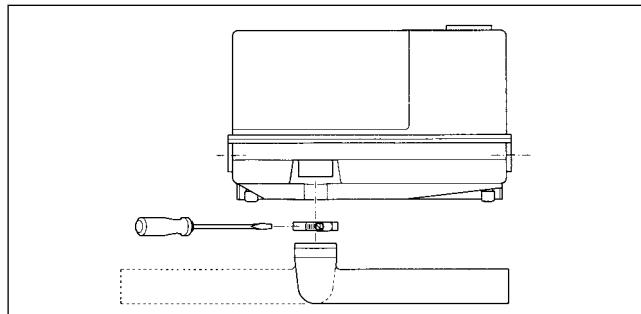

An alternative solution is the connection of a ventilation ( $d=40$  mm) to the roof, that prevents effectively an annoyance caused by bad smell.

**NOTICE!** The place of installation must be safe from flooding and should be well ventilated.

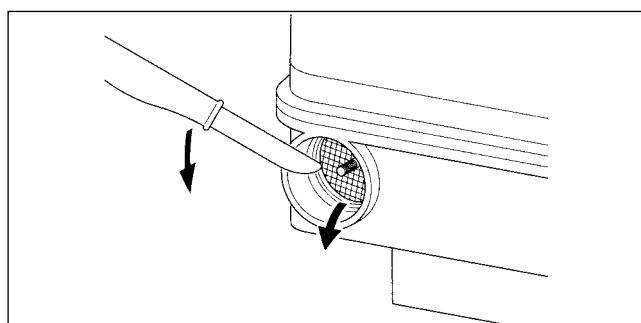

Accessories to fix the unit on the floor against torsion and floating are enclosed.

## MOUNTING

Before installation make sure that all tubes have the required outer diameter, especially the pressure tube.

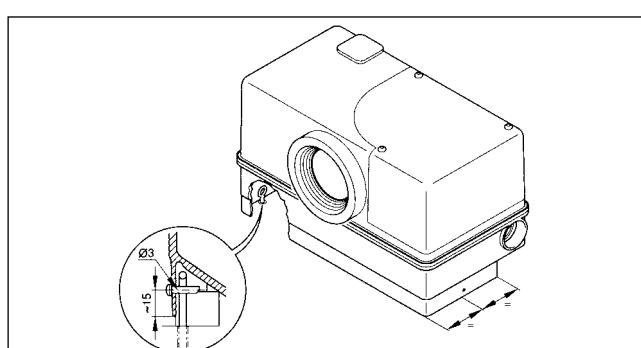

Push the pressure elbow onto the outlet of the unit, choose the direction and fix it with the strap. See to it that the pressure elbow is completely pushed onto the outlet, to secure a save installation of the strap.

To connect a wash-basin, a shower and / or a bidet, remove the plug from the inlet. Pay Notice to the installation notes concerning heights, falls and arrangement.

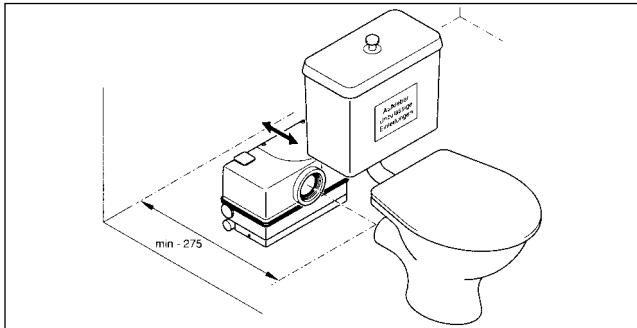

After removing the plug, open the inlet sleeve at the marked point with a knife or a screwdriver.

**NOTICE!** The cut out seal must not be left in the container.

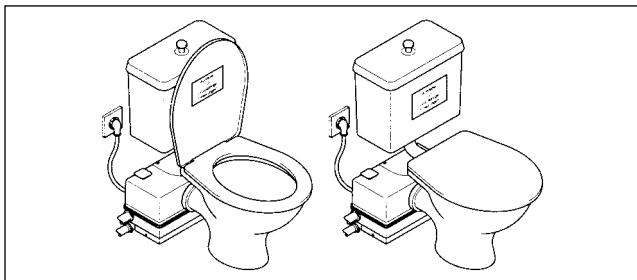

The WCfix 260 can be secured against torsion and floating by using eyelet bolts, dowels and sheet metal screws which are enclosed.

At first mark the dowel holes on the floor with the enclosed drill template. Therefore straighten the template at the wall behind the toilet, check the outlet of the toilet and then draw on the bore holes on the floor. After that straighten the WCfix 260 on the template, fold up the side walls and draw on the bore holes ( $\varnothing 3$ ) on the lower edge of the casing. After drilling the holes into the floor and the container, mount the eyelet bolts.

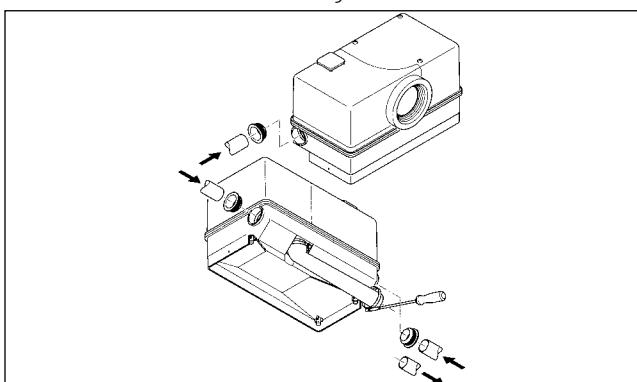

Put the pre-assembled WCfix 260 behind the toilet. Push the unit with the rubber collar DN 100 up to the stop (in the inlet of the tank) onto the outlet of the toilet. If necessary, moisten the rubber collar with soap water and level out the heights with the rubber bases of the unit with washers (not enclosed). Screw the sheet metal screws into the middle of the eyelet plugs.

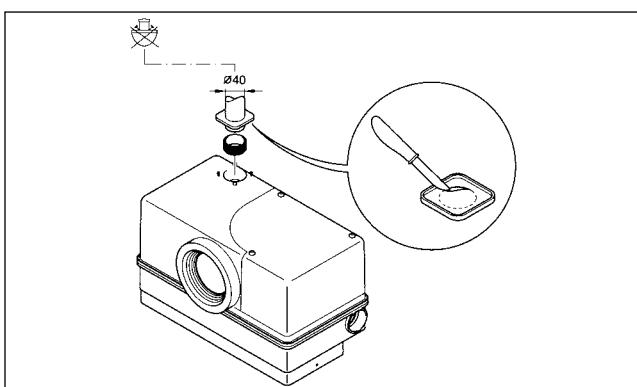

**NOTICE!** The fit of the rubber collar must be perfect.

Fix the enclosed sticker with „Operating Instructions“ in a visible place. The disposal of things like hygienic articles, fibre substances, food waste, solvents, chemicals, etc. can lead to malfunctions and will affect the guarantee.

Put the plug-in seal(s) flush into the inlet sleeve(s). Then put the tube(s) up to the stop into the plug-in seal of the inlet sleeve. Push the pressure elbow with a strap over the pressure line and fix it.

An uptake to the roof must be installed risingly. The connection of the line is the same as the one of the additional connections. The connection sleeve is made for a tube d= 40 mm.

Remove the cap of the casing. If an activated carbon filter is already installed, it must be removed. Put the plug-in seal, into the connection sleeve until the collar of the seal is on the surface of the casing. If both enclosed plug-in seals are already used, please order an extra seal (JP45098).

The cap has a prepared cut out at the inner side, to cover the hole if a ventilation tube will be installed. Remove the cut out with a knife or a screwdriver and burr the separating line.

Push the cap over the ventilation pipe, put the pipe into the seal and press on the cap.

### Practical hints

After using commercial cleaning material, flush several times to ensure that no reminders rest in the unit. Holding devices of permanent cleaning materials must be fixed especially save to prevent them from being flushed into the unit.

### Follow-up time

A short slurping sound should be heard at the end of a pumping process. With large delivery heads it may be necessary to readjust the run-on time. To do this, turn the potentiometer on the control board slightly clockwise. See circuit diagram on page 38.

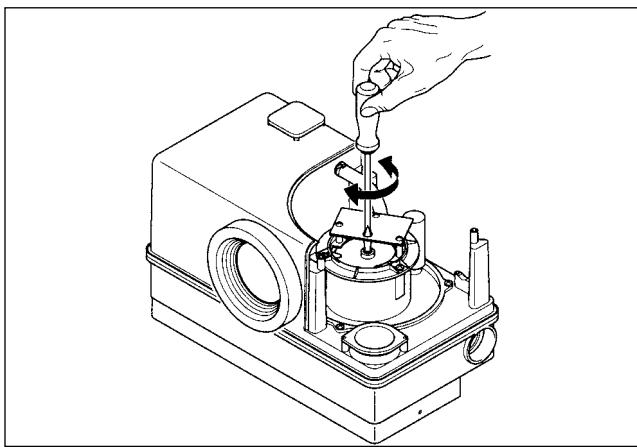

## CLEANING /MAINTENANCE

**NOTICE!** Works on the unit should only be done by qualified electricians.

### **WARNING!**

Pull main plug before any work or repairs on the unit and take steps to ensure that it cannot be energized again.

1. Disassemble the cover. Unscrew three cap screws.

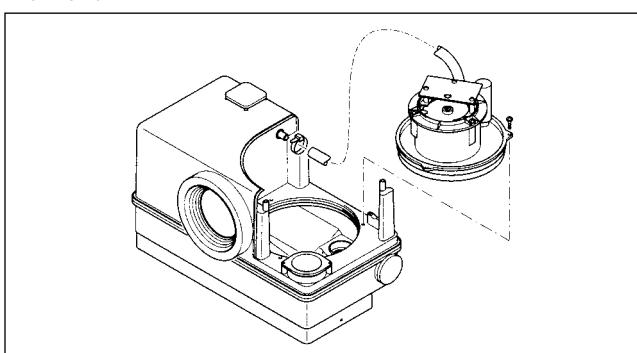

2. In case of any blockages of the unit: Insert a screwdriver through the hole in the Printed Circuit Board into the slotted pump shaft and turn it until the shaft is moving freely. Re-fit the cover and check the pump by a short test run.

After that, control the pump by plugging in the mains plug momentarily.

3. If the unit will not run satisfactorily after the procedure of point 2., the pump with motor must be disassembled.

- Before disassembling the complete pump and motor unit, remove the water from the toilet bowl, detach the pressure elbow connection from the pipework and drain the water off into a flat storage basin, or pump out the water with a drilling machine ( $n > 2000 \text{ min}^{-1}$ , right handed rotation) and a screwdriver bit.

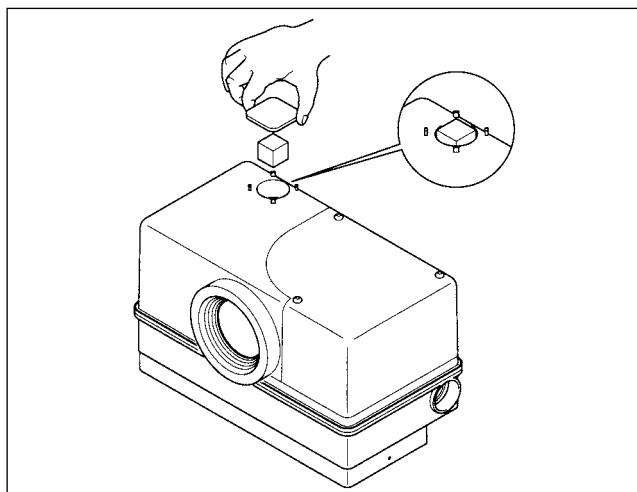

- If necessary, remove the water and any blockages from the tank and the pump etc. and clean all parts.
- Check and clean also the vent pipe and carbon filter plate which must be replaced, if necessary.
- Before re-assembling, the O-rings and seal sleeves must be cleaned and greased.

### Installation / change of the activated carbon filter

To prevent an annoyance caused by bad smell we recommend the installation of the activated carbon filter (enclosure). Therefore the cap of the tank ventilation must be removed. Push the unwrapped activated carbon filter into the cylindric opening.

The filter has a little interfering for a save seat. The edges of the filter will shear off slightly. After that, re-fit the cover. The filter should be changed after malfunctions with overflooding of water through the ventilation valve, in case of bad smells, it should be changed once a year.

## KLEINE HILFE BEI STÖRUNGEN

Problem	Ursache	Abhilfe
WCfix läuft nicht an, Wasser bleibt in dem Toilettenbecken stehen	Stromausfall	Netzspannung prüfen, Sicherung defekt, Netzeleitung beschädigt. ACHTUNG! Spezialleitung darf nur durch unseren Kundendienst oder Elektrofachmann ersetzt werden.
	Laufrad blockiert	siehe "Reinigung / Wartung"
Wasser im Toilettenbecken läuft nur sehr langsam ab	Verstopfung	Spülwassermenge im WC-Spülkasten kontrollieren und ggf. auf 9 l bzw. auf maximale Menge einstellen. Staut das Wasser nicht höher als normal in das WC-Becken zurück, ein weiteres mal spülen und ggf. wiederholen, sofern noch abgepumpt wird. Andernfalls bitte den Kundendienst benachrichtigen.
	Förderhöhe zu groß	siehe "Technische Daten"
Mehrfaches Einschalten des WCfix nach normalem Fördervorgang	<ul style="list-style-type: none"> <li>Das Ventil im Spülkasten ist undicht und es läuft Wasser über das WC-Becken in die Anlage.</li> <li>Nach dem Pumpvorgang läuft Wasser in den WCfix 260 zurück, weil die Rückschlagklappe undicht oder defekt ist.</li> <li>Verstopfung im Behälter vor der Pumpe, so dass Wasser nur in kleinen Intervallen abgepumpt wird.</li> <li>Defekt an dem Niveauschalter der Anlage.</li> </ul>	Spülkastenventil kontrollieren, Rückschlagklappe kontrollieren, wenn noch kein Rückstau im WC-Becken mehrmals in Abständen die Spülung betätigen. Tritt keine Besserung ein, bitte den Kundendienst anrufen.
Erhöhtes Betriebsgeräusch	Fremdkörper in der Pumpe	Motor-Pumpeneinheit ausbauen, siehe "Reinigung/Wartung"
Periodisch auftretende Verstopfung	Keine Homogenisierung des Mediums	Nachlaufzeit durch Fachmann verlängern, bis Schlürfbetrieb kurz hörbar ist

## WHAT TO DO IN THE EVENT OF ANY PROBLEMS

Problem	Cause	Remedy
The unit does not work, and the water does not drain off	Power failure	Check supply voltage, change fuse if necessary, check supply cable  ATTENTION! Special supply cable has to be changed only by qualified electricians.
	Blockage of the pump.	See cleaning and maintenance"
The water in the toilet-basin drains off very slowly	Blockage of the tank inlet, the pump intake or the tank ventilation caused by too much paper and not enough water.	Check flushing volume, if necessary adjust to 9l. If the water does not bank up into the toilet, flush 1x . If the unit operates repeat several times if necessary. If there is no change, please call your service.
	To much delivery height	See Technical data
Several starts after a single operation	If the water flows back into the unit after operation, the flap trap can leak or is defective, otherwise there can be a blockage in the tank or in the pump because of too much paper. .	Use the flushing several times, if there is no change, please call your service.
The unit operates very noisy	Foreign objects in the pump	pump with motor must be disassembled, see maintenance
Periodic blocking	No homogenisation of the media	Extend follow up time until "snore" mode is heard briefly.

## PETITE AIDE AU DÉPANNAGE

Problème	Cause	Solution
Le WCfix ne fonctionne pas, l'eau reste dans la cuvette des toilettes	Panne de courant	Vérifier la tension réseau, fusible défectueux, câble réseau endommagé. ATTENTION ! Seul notre service après-vente ou un électricien peut remplacer un câble spécial.
	Roue à aubes bloquée	cf. « nettoyage/entretien »
L'eau dans la cuvette des toilettes ne s'écoule que très lentement	Obturation	Contrôler la quantité d'eau dans le réservoir de chasse et la régler à 9 litres ou à la quantité maximale autorisée. Si l'eau ne remonte pas dans la cuvette des toilettes à un niveau plus élevé que d'habitude, tirer une nouvelle fois la chasse d'eau et recommencer si nécessaire si la pompe est toujours en fonctionnement. Veuillez informer le service après-vente le cas échéant.
	Hauteur de refoulement trop importante	voir les « caractéristiques techniques »
Le WCfix se met en marche à plusieurs reprises après un refoulement normal	<ul style="list-style-type: none"> <li>La vanne dans le réservoir de chasse fuit et de l'eau s'écoule dans le poste via la cuvette des WC.</li> <li>L'eau retourne dans le WCfix 260 après le procédé de pompage car le clapet anti-retour fuit ou est défectueux.</li> <li>Obstruction dans le collecteur avant la pompe ; l'eau n'est pompée qu'avec de courts intervalles.</li> <li>Défaut du commutateur de niveau du dispositif.</li> </ul>	Contrôler la vanne du réservoir de chasse, contrôler le clapet anti-retour et appuyer plusieurs fois sur la chasse d'eau si l'eau ne remonte toujours pas dans la cuvette des toilettes. Veuillez appeler le service client si vous ne constatez aucune amélioration.
Bruit de fonctionnement élevé	Corps étrangers dans la pompe	Démonter le groupe motopompe, voir « nettoyage/entretien ».
Obturations occasionnelles	Pas d'homogénéisation du fluide	Faire appel à un spécialiste pour augmenter la durée de fonctionnement par temporaire jusqu'à entendre brièvement la pompe aspirer bruyamment.

## KLEINE HULP BIJ STORINGEN

Probleem	Oorzaak:	Verhelping
WCfix start niet op, water blijft in het toiletbekken staan	Stroomuitval	Stroomnetspanning controleren, zekering defect, Stroomnetleiding beschadigd. LET OP! Speciale leiding mag uitsluitend door onze klantendienst of een elektrovakman vervangen worden. zie "Reiniging / Onderhoud"
	Loopwiel geblokkeerd	
Water in het toiletbekken loopt slechts langzaam af	Verstopping	Spoelwaterhoeveelheid in de WC-spoelkast controleren en ev. op 9 l resp. op maximale hoeveelheid instellen. Komt het water niet hoger dan normaal in het WC-bekken terug, nogmaals spoelen en ev. herhalen in zoverre nog afgepompt wordt. In het andere geval de klantendienst op de hoogte brengen. zie "Technische gegevens"
	Transporthoogte te groot	
Meermaals inschakelen van de WCfix na normale transporthandeling	<ul style="list-style-type: none"> <li>Het ventiel in de spoelkast is ondicht en er loopt water via het WC-bekken in de installatie.</li> <li>Na het pompen loopt water in de WCfix 260 terug, omdat de terugslagklep ondicht of defect is.</li> <li>Verstopping in het reservoir voor de pomp zodat water slechts in kleine intervallen afgepompt wordt.</li> <li>Defect aan de niveauschakelaar van de installatie.</li> </ul>	Spoelkastventiel controleren, terugslagklep controleren, wanneer nog geen terugstroming in het WC-bekken meermaals in verschillende tijdsafstanden de spoeling in werking zetten. Treedt geen verbetering op, klantendienst contacteren.
Verhoogd bedrijfsgeruis	Vreemde voorwerpen in de pomp	Motor-pompeenhed demonteren, zie "Reiniging"
Periodiek optredende verstopping	Geen homogenisering van het medium	Nalooptijd door vakman verlengen tot slurpbedrijf kortstondig hoorbaar is

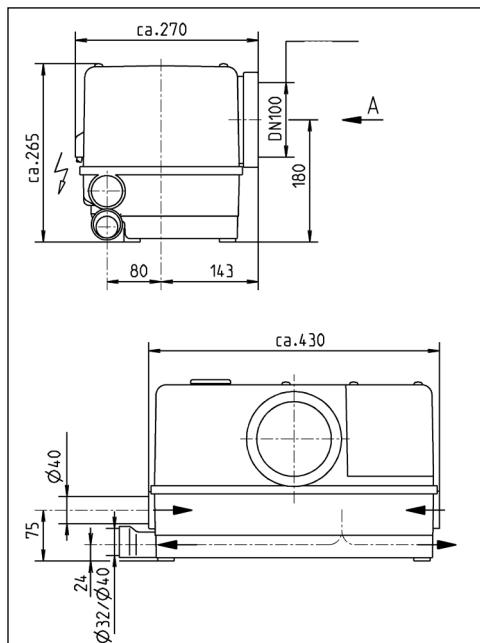

## RIMEDI IN CASO DI GUASTO ALLA STAZIONE DI SOLLEVAMENTO

Guasto	Causa	Rimedio
La stazione WCfix non si avvia, l'acqua rimane nel WC.	Mancanza di corrente elettrica.	Controllare la tensione di rete, il fusibile è bruciato, il cavo di rete è danneggiato. Attenzione! La sostituzione della linea Spezial deve essere effettuata soltanto dal nostro Servizio di Assistenza Clienti o da personale con qualifica simile..
	Girante bloccata	Vedere il capitolo "Pulizia"
L'acqua nel WC defluisce molto lentamente.	L'area del tubo di entrata, della pompa o di ventilazione è ostruita dalla presenza di corpi estranei, ovvero dalla presenza di troppa carta e acqua insufficiente.	Impostare a 9 l la quantità di acqua di risciacquo ella cassetta e azionare più volte il risciacquo. Se la situazione rimane immutata, ricorrere al rimedio descritto nel paragrafo "Pulizia".
	Prevalenza eccessiva	Vedere il paragrafo "Impiego"
La stazione WCfix, dopo una normale operazione di pompaggio, si inserisce ripetutamente.	Valvola di ritegno difettosa o non a tenuta, tubazione di alimentazione del contenitore o area di aspirazione della pompa ostruita.	Azionare il risciacquo più volte. Se la situazione rimane immutata, controllare le valvole di ritegno e il contenitore e pulirli.
Maggiore rumorosità di funzionamento	Presenza di corpi solidi nella pompa	Vedere il paragrafo "Pulizia"
Intasamenti periodici e aspirazione a pelo d'acqua non udibile.	Liquido non omogeneizzato, tempo di ritardo troppo breve.	Prolungare il tempo di ritardo fino a quando l'aspirazione a pelo d'acqua risulta udibile per 1-2 secondi.

## USUWANIE USTEREK

Problem	Przyczyna	Rozwiążanie
Agregat nie rusza, woda pozostaje z misce ustępowej	Awaria sieci elektrycznej	Skontrolować napięcie sieci, uszkodzony bezpiecznik, uszkodzony przewód sieciowy. Uwaga! Specjalny przewód może wymienić tylko nasz serwis lub osoba wykwalifikowana
	Zablokowany wirnik	Patrz „Czyszczenie”
Woda z miski ustępowej odpływa bardzo wolno	Zatkanie w obszarze dopływu, pompy lub wentylacji spowodowane ciałem lub zbyt dużą ilością papieru i za małą ilością wody	Ustawić ilość wody do spłukiwania w spłuczce na 9 l. Jeżeli nie ma zmiany, zastosować środki zaradcze opisane w punkcie „Czyszczenie”
	Za duża wysokość podnoszenia	Patrz „Zastosowanie”
Kilkakrotnie załaczanie agregatu po normalnym cyklu pompowania	Uszkodzone lub nieszczelne klapowe zawory zwrotne. Zatkany dopływ do zbiornika lub obszar wlotowy pompy	Kilkakrotnie spłukać, jeżeli nie ma zmiany skontrolować i oczyścić klapowe zawory zwrotne i zbiornik.
	Uszkodzona mechanika spłuczki	Naprawić armaturę spłuczki
Podwyższony poziom hałasu podczas pracy	Ciało obce w pompie	Patrz „Czyszczenie”
